

In their filing on the subject NOI, International Broadband Electrical Communications, Inc stated "New technologies have been tested, validated, and deployed which prove that BPL can provide the needed services and can do so without interfering with existing wireless or wireline services."

If this is true, if BPL can provide needed services without interfering with other services, why do they ask that Part 15 be modified? Testing in areas where BPL is being deployed on a trial basis show that it does indeed interfere with other services. Part 15 provides important protections to licensed wireless services and should not be modified.
